CHAPTER - 36 PERMANENT MAGNETS

1.
$$m = 10 A-m$$
,

$$d = 5 cm = 0.05 m$$

B =
$$\frac{\mu_0}{4\pi} \frac{m}{r^2} = \frac{10^{-7} \times 10}{\left(5 \times 10^{-2}\right)^2} = \frac{10^{-2}}{25} = 4 \times 10^{-4} \text{ Tesla}$$

2.
$$m_1 = m_2 = 10 \text{ A-m}$$

$$r = 2 cm = 0.02 m$$

we know

Force exerted by tow magnetic poles on each other =
$$\frac{\mu_0}{4\pi} \frac{m_1 m_2}{r^2} = \frac{4\pi \times 10^{-7} \times 10^2}{4\pi \times 4 \times 10^{-4}} = 2.5 \times 10^{-2} \text{ N}$$

3.
$$B = -\frac{dv}{d\ell} \Rightarrow dv =$$

3.
$$B = -\frac{dv}{d\ell} \Rightarrow dv = -B d\ell = -0.2 \times 10^{-3} \times 0.5 = -0.1 \times 10^{-3} \text{ T-m}$$

Since the sigh is –ve therefore potential decreases.
Here
$$dx = 10 \sin 30^{\circ} cm = 5 cm$$

$$\frac{dV}{dx} = B = \frac{0.1 \times 10^{-4} \text{ T} - \text{m}}{5 \times 10^{-2} \text{ m}}$$

Since B is perpendicular to equipotential surface.

Here it is at angle 120° with (+ve) x-axis and B = 2×10^{-4} T

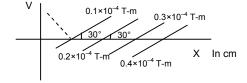

5.
$$B = 2 \times 10^{-4} T$$

$$d = 10 \text{ cm} = 0.1 \text{ m}$$

(a) if the point at end-on postion

B =
$$\frac{\mu_0}{4\pi} \frac{2M}{d^3}$$
 $\Rightarrow 2 \times 10^{-4} = \frac{10^{-7} \times 2M}{(10^{-1})^3}$

$$\Rightarrow \frac{2 \times 10^{-4} \times 10^{-3}}{10^{-7} \times 2} = M \Rightarrow M = 1 \text{ Am}^2$$

(b) If the point is at broad-on position

$$\frac{\mu_0}{4\pi} \frac{M}{d^3} \Rightarrow 2 \times 10^{-4} = \frac{10^{-7} \times M}{(10^{-1})^3} \Rightarrow M = 2 \text{ Am}^2$$

6. Given:

$$\theta$$
 = tan⁻¹ $\sqrt{2}$ \Rightarrow tan θ = $\sqrt{2}$ \Rightarrow 2 = tan² θ

$$\Rightarrow \tan \theta = 2 \cot \theta \Rightarrow \frac{\tan \theta}{2} = \cot \theta$$

We know
$$\frac{\tan \theta}{2} = \tan \alpha$$

Comparing we get, $\tan \alpha = \cot \theta$

or,
$$\tan \alpha = \tan(90 - \theta)$$

or
$$\alpha = 90 - \theta$$

or
$$\theta + \alpha = 90$$

Hence magnetic field due to the dipole is $\perp r$ to the magnetic axis.

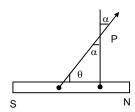

7. Magnetic field at the broad side on position:

$$B = \frac{\mu_0}{4\pi} \frac{M}{\left(d^2 + \ell^2\right)^{3/2}}$$

$$d = 3 cm$$

$$\Rightarrow 4 \times 10^{-6} = \frac{10^{-7} \times m \times 8 \times 10^{-2}}{\left(9 \times 10^{-4} + 16 \times 10^{-4}\right)^{3/2}} \Rightarrow 4 \times 10^{-6} = \frac{10^{-9} \times m \times 8}{\left(10^{-4}\right)^{3/2} + \left(25\right)^{3/2}}$$

$$\Rightarrow m = \frac{4 \times 10^{-6} \times 125 \times 10^{-8}}{8 \times 10^{-9}} = 62.5 \times 10^{-5} A-m$$

We know for a magnetic dipole with its north pointing the north, the neutral point in the broadside on position.

Again
$$\vec{B}$$
 in this case = $\frac{\mu_0 M}{4\pi d^3}$

$$\therefore \frac{\mu_0 M}{4\pi d^3} = \overrightarrow{B_H} \text{ due to earth}$$

$$\Rightarrow \frac{10^{-7} \times 1.44}{d^3} = 18 \,\mu\text{T}$$

$$\Rightarrow \frac{10^{-7} \times 1.44}{d^3} = 18 \times 10^{-6}$$

$$\Rightarrow$$
 d³ = 8 × 10⁻³

$$\Rightarrow$$
 d = 2 × 10⁻¹ m = 20 cm

In the plane bisecting the dipole.

When the magnet is such that its North faces the geographic south of earth. The neutral point lies along the axial line of the magnet.

$$\frac{\mu_0}{4\pi}\frac{2M}{d^3} = 18 \times 10^{-6} \Rightarrow \frac{10^{-7} \times 2 \times 0.72}{d^3} = 18 \times 10^{-6} \Rightarrow d^3 = \frac{2 \times 0.7 \times 10^{-7}}{18 \times 10^{-6}}$$

$$\Rightarrow d = \left(\frac{8 \times 10^{-9}}{10^{-6}}\right)^{1/3} = 2 \times 10^{-1} \text{ m} = 20 \text{ cm}$$

10. Magnetic moment = $0.72\sqrt{2}$ A-m² = M

$$B = \frac{\mu_0}{4\pi} \frac{M}{d^3}$$
 $B_H = 18 \mu T$

$$B_{H} = 18 \mu T$$

$$\Rightarrow \frac{4\pi \times 10^{-7} \times 0.72\sqrt{2}}{4\pi \times d^3} = 18 \times 10^{-6}$$

$$\Rightarrow d^3 = \frac{0.72 \times 1.414 \times 10^{-7}}{18 \times 10^{-6}} = 0.005656$$

$$\Rightarrow$$
 d \approx 0.2 m = 20 cm

11. The geomagnetic pole is at the end on position of the earth.

B =
$$\frac{\mu_0}{4\pi} \frac{2M}{d^3} = \frac{10^{-7} \times 2 \times 8 \times 10^{22}}{(6400 \times 10^3)^3} \approx 60 \times 10^{-6} \text{ T} = 60 \text{ }\mu\text{T}$$

12.
$$\vec{B} = 3.4 \times 10^{-5} \text{ T}$$

Given
$$\frac{\mu_0}{4\pi} \frac{M}{R^3} = 3.4 \times 10^{-5}$$

$$\Rightarrow$$
 M = $\frac{3.4 \times 10^{-5} \times R^3 \times 4\pi}{4\pi \times 10^{-7}}$ = 3.4 × 10² R³

$$\vec{B}$$
 at Poles = $\frac{\mu_0}{4\pi} \frac{2M}{R^3} = 6.8 \times 10^{-5} \text{ T}$

13.
$$\delta(dip) = 60^{\circ}$$

$$B_H = B \cos 60^{\circ}$$

$$\Rightarrow$$
 B = 52 × 10⁻⁶ = 52 μ T

B_V = B sin δ = 52 × 10⁻⁶
$$\frac{\sqrt{3}}{2}$$
 = 44.98 μT ≈ 45 μT

14. If δ_1 and δ_2 be the apparent dips shown by the dip circle in the $2\perp r$ positions, the true dip δ is given by $\cot^2 \delta = \cot^2 \delta_1 + \cot^2 \delta_2$

$$\Rightarrow$$
 Cot² δ = Cot² 45° + Cot² 53°

$$\Rightarrow$$
 Cot² δ = 1.56 \Rightarrow δ = 38.6 \approx 39°

$$B_{H} = \frac{\mu_0 in}{2r}$$

Give :
$$B_H = 3.6 \times 10^{-5} \text{ T}$$

i = 10 mA = 10^{-2} A

$$\theta = 45^{\circ}$$

tan $\theta = 1$

$$r = 10 \text{ cm} = 0.1 \text{ m}$$

$$n = \frac{B_H \tan \theta \times 2r}{\mu_0 i} = \frac{3.6 \times 10^{-5} \times 2 \times 1 \times 10^{-1}}{4\pi \times 10^{-7} \times 10^{-2}} = 0.5732 \times 10^3 \approx 573 \text{ turns}$$

$$A = 2 \text{ cm} \times 2 \text{ cm} = 2 \times 2 \times 10^{-4} \text{ m}^2$$

$$i = 20 \times 10^{-3} A$$

$$B = 0.5 T$$

$$\tau = ni(\vec{A} \times \vec{B}) = niAB \sin 90^{\circ} = 50 \times 20 \times 10^{-3} \times 4 \times 10^{-4} \times 0.5 = 2 \times 10^{-4} \text{ N-M}$$

17. Given
$$\theta = 37^{\circ}$$

$$d = 10 \text{ cm} = 0.1 \text{ m}$$

We know

$$\frac{M}{B_H} = \frac{4\pi}{\mu_0} \frac{(d^2 - \ell^2)^2}{2d} \tan \theta = \frac{4\pi}{\mu_0} \times \frac{d^4}{2d} \tan \theta \quad [As the magnet is short]$$

$$=\frac{4\pi}{4\pi\times10^{-7}}\times\frac{(0.1)^3}{2}\times\tan 37^\circ = 0.5\times0.75\times1\times10^{-3}\times10^7 = 0.375\times10^4 = 3.75\times10^3 \text{ A-m}^2\text{ T}^{-1}$$

18.
$$\frac{M}{B_H}$$
 (found in the previous problem) = 3.75 ×10³ A-m² T⁻¹

$$\theta = 37^{\circ}, d =$$

$$\frac{M}{B_H} = \frac{4\pi}{\mu_0} (d^2 + \ell^2)^{3/2} \tan \theta$$

$$\Rightarrow \frac{M}{B_H} = \frac{4\pi}{\mu_0} d^3 Tan\theta \Rightarrow 3.75 \times 10^3 = \frac{1}{10^{-7}} \times d^3 \times 0.75$$

$$\Rightarrow d^3 = \frac{3.75 \times 10^3 \times 10^{-7}}{0.75} = 5 \times 10^{-4}$$

$$\Rightarrow$$
 d = 0.079 m = 7.9 cm

19. Given
$$\frac{M}{B_H} = 40 \text{ A-m}^2/\text{T}$$

Since the magnet is short 'l' can be neglected

So,
$$\frac{M}{B_H} = \frac{4\pi}{\mu_0} \times \frac{d^3}{2} = 40$$

$$\Rightarrow d^{3} = \frac{40 \times 4\pi \times 10^{-7} \times 2}{4\pi} = 8 \times 10^{-6}$$

$$\Rightarrow$$
 d = 2 × 10⁻² m = 2 cm

with the northpole pointing towards south.

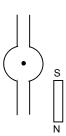

$$T = 2\pi \sqrt{\frac{I}{MB_H}}$$

$$\Rightarrow \frac{\pi}{10} = 2\pi \sqrt{\frac{1.2 \times 10^{-4}}{M \times 30 \times 10^{-6}}}$$

$$\Rightarrow \left(\frac{1}{20}\right)^2 = \frac{1.2 \times 10^{-4}}{\text{M} \times 30 \times 10^{-6}}$$

$$\Rightarrow M = \frac{1.2 \times 10^{-4} \times 400}{30 \times 10^{-6}} = 16 \times 10^{2} \text{ A-m}^{2} = 1600 \text{ A-m}^{2}$$

21. We know:
$$\upsilon = \frac{1}{2\pi} \sqrt{\frac{\text{mB}_{H}}{\text{I}}}$$

For like poles tied together

 $M = M_1 - M_2$

For unlike poles $M' = M_1 + M_2$

$$N \leftarrow S$$
 $S \rightarrow N$

$$\begin{split} &\frac{\upsilon_1}{\upsilon_2} = \sqrt{\frac{M_1 - M_2}{M_1 + M_2}} \implies \left(\frac{10}{2}\right)^2 = \frac{M_1 - M_2}{M_1 + M_2} \implies 25 = \frac{M_1 - M_2}{M_1 + M_2} \\ &\implies \frac{26}{24} = \frac{2M_1}{2M_2} \implies \frac{M_1}{M_2} = \frac{13}{12} \end{split}$$

22.
$$B_H = 24 \times 10^{-6} \text{ T}$$

B = B_H - B_{wire} =
$$2.4 \times 10^{-6} - \frac{\mu_0}{2\pi} \frac{i}{r} = 24 \times 10^{-6} - \frac{2 \times 10^{-7} \times 18}{0.2} = (24 - 10) \times 10^{-6} = 14 \times 10^{-6}$$

$$T = 2\pi \sqrt{\frac{I}{MB_{H}}} \qquad \frac{T_{1}}{T_{2}} = \sqrt{\frac{B}{B_{H}}}$$

$$\Rightarrow \frac{0.1}{T_{2}} = \sqrt{\frac{14 \times 10^{-6}}{24 \times 10^{-6}}} \Rightarrow \left(\frac{0.1}{T_{2}}\right)^{2} = \frac{14}{24} \Rightarrow T_{2}^{2} = \frac{0.01 \times 14}{24} \Rightarrow T_{2} = 0.076$$

23. T =
$$2\pi \sqrt{\frac{I}{MB_{u}}}$$
 Here I' = 2I

$$T_1 = \frac{1}{40} \text{ min}$$
 $T_2 = ?$

$$\frac{\mathsf{T}_1}{\mathsf{T}_2} = \sqrt{\frac{\mathsf{I}}{\mathsf{I}'}}$$

$$\Rightarrow \frac{1}{40T_2} = \sqrt{\frac{1}{2}} \Rightarrow \frac{1}{1600T_2^2} = \frac{1}{2} \Rightarrow T_2^2 = \frac{1}{800} \Rightarrow T_2 = 0.03536 \text{ min}$$

For 1 oscillation Time taken = 0.03536 min.

For 40 Oscillation Time = $4 \times 0.03536 = 1.414 = \sqrt{2}$ min

24.
$$\gamma_1 = 40$$
 oscillations/minute

$$B_{H} = 25 \mu T$$

m of second magnet = 1.6 A-m^2

$$d = 20 \text{ cm} = 0.2 \text{ m}$$

(a) For north facing north

$$\gamma_{1} = \frac{1}{2\pi} \sqrt{\frac{MB_{H}}{I}} \qquad \gamma_{2} = \frac{1}{2\pi} \sqrt{\frac{M(B_{H} - B)}{I}}$$

$$B = \frac{\mu_{0}}{4\pi} \frac{m}{d^{3}} = \frac{10^{-7} \times 1.6}{8 \times 10^{-3}} = 20 \ \mu\text{T}$$

$$\frac{\gamma_{1}}{\gamma_{2}} = \sqrt{\frac{B}{B_{H} - B}} \Rightarrow \frac{40}{\gamma_{2}} = \sqrt{\frac{25}{5}} \Rightarrow \gamma_{2} = \frac{40}{\sqrt{5}} = 17.88 \approx 18 \text{ osci/min}$$

(b) For north pole facing south

$$\begin{split} \gamma_1 &= \frac{1}{2\pi} \sqrt{\frac{\text{MB}_{\text{H}}}{\text{I}}} & \gamma_2 = \frac{1}{2\pi} \sqrt{\frac{\text{M}(\text{B}_{\text{H}} - \text{B})}{\text{I}}} \\ \frac{\gamma_1}{\gamma_2} &= \sqrt{\frac{\text{B}}{\text{B}_{\text{H}} - \text{B}}} \ \Rightarrow \frac{40}{\gamma_2} = \sqrt{\frac{25}{45}} \ \Rightarrow \gamma_2 = \frac{40}{\sqrt{\left(\frac{25}{45}\right)}} = 53.66 \approx 54 \text{ osci/min} \end{split}$$
